

SUMMARY

Applied AI Engineer, graduate in AI & Data Science with a dual degree in Management. At the crossroads of software engineering and AI, I build reliable multi-agent systems designed for production. My R&D and healthcare experience taught me to work with sensitive data under high quality standards. Curious and determined, I learn fast and see complex problems through, even when it means upskilling on my own. Fluent in French and English, comfortable in international teams.

EXPERIENCES

Applied AI Engineer, VIDAL France.

February 2026 - July 2026

- Outline
- Joined the AI team of VIDAL, France's leading medical and pharmaceutical reference platform (200+ employees, used by 90% of French hospitals), to build a generative AI solution helping physicians search and synthesize information from VIDAL's databases. My mission then evolved into building an AI assistant for use during patient consultations.
- Key Achievements
- Built a RAG ingestion pipeline for VIDAL's medical content: fetched, parsed and vectorized 20,000+ multi-page documents (~230k chunks) into Qdrant across 3 differently structured domains, with hybrid retrieval (dense + sparse) and Cohere reranking.
 - Re-architected it into an asynchronous streaming pipeline (Python concurrency, gRPC, Qdrant batching and indexing tuning), cutting run time from 5h30 to 38 min (8x faster).
 - Prototyped in 3 days, then iterated over 3 months, a multi-agent system (ReAct + MCP) that turns patient FHIR records into structured, sourced clinical suggestions. Presented to clients and taken over by VIDAL's AI team.
 - Reduced patient-record token usage by ~67% with a deterministic, lossless FHIR-to-YAML compaction (metadata blacklist, attribute merging), with no loss of clinical information beyond anonymized fields.
 - Used Langfuse traces to analyze the agent's tool-selection errors and improved tool descriptions so it picks the right tool more reliably.

Junior R&D Developer, Weda S.A.S.

January 2023 - June 2023

- Outline
- Joined the R&D team of a leading French medical software company (100+ employees) to help physicians run consultations and manage the full patient care pathway.
- Key Achievements
- Proposed and led an NLP tool for the Data Recovery team that maps physicians' data from other vendors onto Weda's structure, cutting the team's workload by 50%.
 - Integration of an electronic document signature API capable of more than 1,000 simultaneous submissions.
 - Designed a secure export system that extracts a physician's or practice's complete patient data.

CS Internship R&D, Weda S.A.S. & Vidal.

April 2022 - July 2022

- Built a secure system delivering medical test results to physicians in real time via Bioserveur's proprietary API, using C# parallelization to keep latency under 20 ms.
- Developed a real-time monitoring tool that tracks the health of Weda's databases.
- NLP: Text Preprocessing (tokenization, stemming, lemmatization, regex) and Entity Recognition.

PROJECTS & ACHIEVEMENTS

- CLIP model on 600 images (TensorFlow/Keras): frozen ResNet50 + SmallBERT from scratch, contrastive learning in a 128-d shared space (2025) [\[Portfolio\]](#)
- Multi-label classification of tweets. Hyperparameter optimization (Optuna), F1-score. (2025)
- Medical RDF knowledge graph based on 50,000 Wikipedia pages. (2025)
- Marching Cubes algorithm with GPU parallelization for performance optimization (2023)

EDUCATION

Master's in Artificial Intelligence and Data Science at the University of Montpellier.

2023 - 2026

- Dual Degree: Master's in Management from IAE, University of Montpellier
- Machine Learning, NLP, Parallel Programming, Database Administration, BigData

Pool - École 42, Paris

August 2023

Top student. Advanced C and Shell: data structures (built from scratch), memory management (pointers).

Completion of two years at CESI Montpellier, a computer science engineering school.

2020 - 2022

BAC S-Scientifique, with a specialization in engineering science and the European Section

2017 - 2020

TECHNICAL SKILLS

- AI: PyTorch, Tensorflow, Scikit-learn, Qdrant, Keras, RAG, LangChain, LangGraph, Pydantic-AI, ReAct Loop, Multi-agent, MCP, MLOps
- Software: Python, Typescript, Svelte, Pandas, SQL, Spark, C#, C++, concurrency
- CI/CD & tools: Docker, git (advanced), Github actions, Jenkins, Langfuse, FastAPI

HOBBIES

- Technology: Competitive programming Club, Electronics projects, Building and piloting an FPV drone
- Sports: Swimming (20 years of practice), practicing basketball
- Hobbies & Travel: Photography, Film, Literature, Chess, Traveling in Europe, North Africa & Asia
